

MIXTURE OF LOW-BOILING LIQUIDS WITH PRODUCTS DISPENSABLE BY
PUMPS

ABSTRACT

5 Fluid mixture which comprises at least one low-boiling
liquid, and which during use generates a low vapour
pressure, said mixture being dispensable by a manually
operated dispensing pump mounted on a hermetically sealed
container of this mixture. The low vapour pressure
10 developed by the low-boiling liquid is such as to prevent a
vacuum being created in the container interior when the
mixture is dispensed by the pump, in order to allow correct
pump operation.
